Green Thread

06 March 2026 20:48

Green Thread

GreenThreadModel	Native OS model
Solaris O/S	Android, Window, IOS
Macintosh	
Linux	

Java multithreading concept is implemented by using the following two models:

1. Green thread model. 2. Native OS model.

1. Green thread model: The thread which is managed completely by JVM without taking underlying O/S support is called Green Thread. Very few OS like Sun Solaris (Oracle), Macintosh or Linux provide support for Green Thread model.

Anyways green-thread model is deprecated (legacy) and not recomended to use.

Native OS model :- The thread which is managed by JVM, with the help of underlying OS, is called native OS model. All windows based OS provide support for native OS model.

How to stop a Thread?

If we call stop() method, then immediately the thread will enter into dead state.

Anyways stop() method is deprecated and not recomended to use.

```
package MyThreads;
class TestMyThreadOne {
    public static void main(String[] args) throws InterruptedException {
```

```java
        MyThreadOne mto = new MyThreadOne(100);
        System.out.println();
        if(mto.isDaemon()){
            System.out.println(mto+" is a daemon");
        }
        else{
            System.out.println(mto+ " is not a daemon");
        }
        mto.setDaemon(true);
        mto.start();
        System.out.println("Main Thread");
        Thread.sleep(3000);
        mto.stop();
    }
}
```

Output:

```
Thread[#21,Thread-0,5,main] is not a daemon
Main Thread
Exception in thread "Thread-0" java.lang.NullPointerException: Cannot invoke
"java.lang.Thread.join()" because "MyThreads.MyThreadOne.mt" is null
        at MyThreads.MyThreadOne.run(MyThreadOne.java:17)
Exception in thread "main" java.lang.UnsupportedOperationException
        at java.base/java.lang.Thread.stop(Thread.java:1667)
        at MyThreads.TestMyThreadOne.main(TestMyThreadOne.java:18)
```
